**Question 1**

Correct

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that  $A[i] - A[j] = k$ ,  $i \neq j$ .

**Input Format**

1. First line is number of test cases T. Following T lines contain:
2. N, followed by N integers of the array
3. The non-negative integer k

**Output format**

Print 1 if such a pair exists and 0 if it doesn't.

**Example****Input:**

```
1
3 1 3 5
4
```

**Output:**

```
1
```

**Input:**

```
1
3 1 3 5
99
```

**Output:**

```
0
```

**Answer:** (penalty regime: 0 %)

```
1 #include <stdio.h>
2 int main(){
3     int T;
4     scanf("%d", &T);
```

```

5   while (T--) {
6       int N;
7       scanf ("%d",&N);
8       int A[N];
9       for (int i=0; i<N; i++)
10      scanf ("%d",&A[i]);
11
12      int k;
13      scanf ("%d",&k);
14
15      int i=0, j=1, found=0;
16
17      while (i<N && j<N) {
18          int diff = A[j]-A[i];
19
20          if (i !=j && diff ==k) {
21              found = 1;
22              break;
23          }
24          else if (diff<k)
25              j++;
26          else i++;
27      }
28      printf ("%d\n",found);
29  }
30
31 return 0;
}

```

**Question 2**

Correct

Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year,  $x$ , is numbered from 1 to  $Y$ . On days when  $x$  is odd, Sam will buy  $x$  chocolates; on days when  $x$  is even, Sam will not purchase any chocolates.

Complete the code in the editor so that for each day  $N_i$  (where  $1 \leq x \leq N \leq Y$ ) in array  $arr$ , the number of chocolates Sam purchased (during days 1 through  $N$ ) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.

**Input Format**

The program takes an array of integers.

The locked code in the editor handles reading the following input from `stdin`, assembling it into an array of integers ( $arr$ ), and calling `calculate(arr)`.

The first line of input contains an integer,  $T$  (the number of test cases). Each line  $i$  of the  $T$  subsequent lines describes the  $i$ th test case as an integer,  $N_i$  (the number of days).

**Constraints**

$$1 \leq T \leq 2 \times 10^5$$

$$1 \leq N \leq 2 \times 10^6$$

$$1 \leq x \leq N \leq Y$$

**Output Format**

For each test case,  $T_i$  in  $arr$ , your `calculate` method should print the total number of chocolates Sam purchased by day  $N_i$  on a new line.

## Explanation

### Test Case 0: N = 1

Sam buys 1 chocolate on day 1, giving us a total of 1 chocolate. Thus, we print 1 on a new line.

### Test Case 1: N = 2

Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a total of 1 chocolate. Thus, we print 1 on a new line.

### Test Case 2: N = 3

Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a total of 4 chocolates. Thus, we print 4 on a new line.

**Answer:** (penalty regime: 0 %)

```
1 #include <stdio.h>
2 void calculate (int arr[],int T){
3     for (int i=0; i<T; i++){
4         long long N = arr[i];
5         long long k= (N+1)/2;
6         printf ("%lld\n",k * k);
7     }
8 }
9 int main (){
10     int T;
11     scanf ("%d",&T);
12     int arr[T];
13     for (int i=0; i<T; i++) {
14         scanf ("%d",&arr[i]);
15     }
16     calculate (arr, T);
17     return 0;
18 }
19
20 }
```

**Question 3**

Correct

The number of goals achieved by two football teams in matches in a league is given in the form of two lists. Consider:

- Football team A, has played three matches, and has scored { 1 , 2 , 3 } goals in each match respectively.
- Football team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
- Your task is to compute, for each match of team B, the total number of matches of team A, where team A has scored less than or equal to the number of goals scored by team B in that match.
- In the above case:
  - For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
  - For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.

Hence, the answer: {2, 3}.

Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the total number of elements nums[j] satisfying  $\text{nums}[j] \leq \text{maxes}[i]$  where  $0 \leq j < n$  and  $0 \leq i < m$ , in the given order.

It has the following:

nums[nums[0],...nums[n-1]]: first array of positive integers

maxes[maxes[0],...maxes[n-1]]: second array of positive integers

Constraints

- $2 \leq n, m \leq 105$
- $1 \leq \text{nums}[j] \leq 109$ , where  $0 \leq j < n$ .
- $1 \leq \text{maxes}[i] \leq 109$ , where  $0 \leq i < m$ .

**Input Format For Custom Testing**

Input from stdin will be processed as follows and passed to the function.

The first line contains an integer n, the number of elements in nums.

The next n lines each contain an integer describing  $\text{nums}[j]$  where  $0 \leq j < n$ .

The next line contains an integer m, the number of elements in maxes.

The next m lines each contain an integer describing  $\text{maxes}[i]$  where  $0 \leq i < m$ .

### Sample Case 0

#### Sample Input 0

```
4  
1  
4  
2  
4  
2  
3  
5
```

#### Sample Output 0

```
2  
4
```

#### Explanation 0

We are given  $n = 4$ ,  $\text{nums} = [1, 4, 2, 4]$ ,  $m = 2$ , and  $\text{maxes} = [3, 5]$ .

1. For  $\text{maxes}[0] = 3$ , we have 2 elements in  $\text{nums}$  ( $\text{nums}[0] = 1$  and  $\text{nums}[2] = 2$ ) that are  $\leq \text{maxes}[0]$ .
2. For  $\text{maxes}[1] = 5$ , we have 4 elements in  $\text{nums}$  ( $\text{nums}[0] = 1$ ,  $\text{nums}[1] = 4$ ,  $\text{nums}[2] = 2$ , and  $\text{nums}[3] = 4$ ) that are  $\leq \text{maxes}[1]$ .

Thus, the function returns the array  $[2, 4]$  as the answer.

### Sample Case 1

#### Sample Input 1

```
5  
2  
10  
5  
4  
8  
4  
3  
1  
7
```

8

## Sample Output 1

```

1
0
3
4

```

## Explanation 1

We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].

1. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is  $\leq$  maxes[0].
2. For maxes[1] = 1, there are 0 elements in nums that are  $\leq$  maxes[1].
3. For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are  $\leq$  maxes[2].
4. For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are  $\leq$  maxes[3].

Thus, the function returns the array [1, 0, 3, 4] as the answer.

**Answer:** (penalty regime: 0 %)

```

1 #include <stdio.h>
2 #include <stdlib.h>
3 int compare (const void *a,const void *b) {
4     return (*(int *)a- *(int *)b);
5 }
6 int upper_bound( int arr[], int n, int key) {
7     int low=0, high = n;
8     while (low < high) {
9         int mid = (low + high)/2;
10        if (arr[mid] <= key)
11            low=mid + 1;
12        else
13            high =mid;
14    }
15    return low;
16 }
17 int main () {
18     int n, m;
19     scanf ("%d", &n);
20     int nums [n];
21     for (int i=0; i<n; i++)
22         scanf ("%d", &nums[i]);
23     scanf ("%d", &m);
24     int maxes[m];
25     for (int i=0; i<m; i++)
26         scanf ("%d", &maxes[i]);

```

```
20     SCNRIT ( &u , maxes );
21     qsort(nums,n,sizeof(int), compare);
22     for (int i=0; i<m; i++) {
23         int count = upper_bound (nums, n, maxes[i]);
24         printf ("%d\n",count);
25     }
26     return 0;
27 }
```

|   | Input  | Expected         | Got              |   |
